A Included parliamentary configurations

Table S.1 reports the parliamentary configurations we have considered to construct our sample of parties. We based our selection on the *Parliaments and Government Database* (ParlGov) (Döring and Manow, 2019) as of November 26, 2019.

In each country-specific panel, Table S.1 reports the parliamentary configuration(s) that emerged from a given election, the parties with parliamentary representation in the given parliament, and their number of seats. Underlined parties were in cabinet. Bold and underlined parties sponsored the prime minister in a given configuration. We report information on the tweets we have collected for parties in these parliamentary configurations in the last group of columns.

We have also collected the tweets of parties without parliamentary representation before their (re)entry into parliament. Table S.2 reports statistics for these cases.

Moreover, we compiled information on parliamentary configurations missing in the ParlGov database when we queried it in November 2019. These cases are listed in Table S.3.

Table S.1: Parties in parliamentary configurations by country and election. Part names listed only if (i) the party had at least one seat in parliament *and* (ii) it was tweeting at least once in the duration of the respective parliamentary configuration. Party marked bold if it sponsored the prime minister in the given configuration, underlined if it was in government.

Country	Election date	Seats	Recorded parties		Parl. configuration		Tweets recorded

B Computing anti-elite emphasis estimates

Table S.4 reports the proportion of tweets per country predicted to feature general elite criticism depending on whether a tweet is predicted to contain political content. It shows that the prevalence of general elite criticism is very low in non-political tweets. This supports our decision to analyze the prevalence of general elite criticism only in political tweets.

Table S.4: Numbers and (row) percentages of tweets in outcome classes per country by whether or not their content is likely political.

		General elite criticism			
		"Yes"		"No"	
		"Political"	<i>N</i>	%	<i>N</i>

B.1 Missigness and level of aggregation

Once tweets are labeled, the question arises for what time intervals post-level predictions can be aggregated to obtain reliable time-series estimates. While Twitter data generally promises temporally far more fine-grained measurement than other types of political text data, Figure S.1 shows that parties' Twitter activity patterns imply practical limits. Specifically, it shows in panel (a) that different proportions of zero-tweet data points result when aggregating at different temporal units (half years, quarters, months, or weeks). Moreover, panel (b) shows that aggregating at more granular temporal units generally implies aggregating from fewer observations.

Figure S.1: Proportion of party-time units with at least one tweet (left) and distribution of numbers of tweets per time unit on \log_{10} -scale in subset of units with non-zero numbers of tweets (right) by country. Dark gray shading indicates units with non-zero numbers of tweets.

If not stated otherwise, we have thus used quarters (three-month periods) as temporal units of aggregation in our analyses. Aggregating at quarter units allows striking a balance between temporally granular and reliable measurement. Figure S.2 shows the missingness patterns resulting from this decision.

Figure S.2: Missingness in party-quarter timeseries. Shaded areas mark quarters for which parties' tweets have been recorded either because the party was in parliament or it was about to enter parliament in an upcoming election. Dark shaded areas mark quarters for which no tweets were available and hence party-quarter estimates are missing.

B.2 Time-series for all parties in our dataset

Figures S.8 plots time-series estimates for all countries and parties included in our study.

Figure S.3: Probability-based estimates of parties’ anti-elite strategies computed at party-quarters. One square plotted per party-quarter estimate. Coloring of squares indicates the estimated salience of anti-elite rhetoric according to the proportion of “general” elite criticism instances. Lighter values correspond to higher salience. Grey-shaded squares mark party-quarters for which no tweets are available to compute an estimate although the party was included in our dataset in this quarter. Squares left blank (white) mark periods for which a given party was not included in our dataset in this quarter.

Figure S.4: Probability-based estimates of parties’ anti-elite strategies computed at party-quarters. One square plotted per party-quarter estimate. Coloring of squares indicates the estimated salience of anti-elite rhetoric according to the proportion of “general” elite criticism instances. Lighter values correspond to higher salience. Grey-shaded squares mark party-quarters for which no tweets are available to compute an estimate although the party was included in our dataset in this quarter. Squares left blank (white) mark periods for which a given party was not included in our dataset in this quarter.

Figure S.5: Probability-based estimates of parties’ anti-elite strategies computed at party-quarters. One square plotted per party-quarter estimate. Coloring of squares indicates the estimated salience of anti-elite rhetoric according to the proportion of “general” elite criticism instances. Lighter values correspond to higher salience. Grey-shaded squares mark party-quarters for which no tweets are available to compute an estimate although the party was included in our dataset in this quarter. Squares left blank (white) mark periods for which a given party was not included in our dataset in this quarter.

Figure S.6: Probability-based estimates of parties’ anti-elite strategies computed at party-quarters. One square plotted per party-quarter estimate. Coloring of squares indicates the estimated salience of anti-elite rhetoric according to the proportion of “general” elite criticism instances. Lighter values correspond to higher salience. Grey-shaded squares mark party-quarters for which no tweets are available to compute an estimate although the party was included in our dataset in this quarter. Squares left blank (white) mark periods for which a given party was not included in our dataset in this quarter.

Figure S.7: Probability-based estimates of parties’ anti-elite strategies computed at party-quarters. One square plotted per party-quarter estimate. Coloring of squares indicates the estimated salience of anti-elite rhetoric according to the proportion of “general” elite criticism instances. Lighter values correspond to higher salience. Grey-shaded squares mark party-quarters for which no tweets are available to compute an estimate although the party was included in our dataset in this quarter. Squares left blank (white) mark periods for which a given party was not included in our dataset in this quarter.

Figure S.8: Probability-based estimates of parties’ anti-elite strategies computed at party-quarters. One square plotted per party-quarter estimate. Coloring of squares indicates the estimated salience of anti-elite rhetoric according to the proportion of “general” elite criticism instances. Lighter values correspond to higher salience. Grey-shaded squares mark party-quarters for which no tweets are available to compute an estimate although the party was included in our dataset in this quarter. Squares left blank (white) mark periods for which a given party was not included in our dataset in this quarter.
